

SAVI is asking for changes to part 15 rules in order to allow them to send more data than they can with their existing system.

If SAVI were to use the package ID that they read using their current RFID system as a key into a relational data base system they would be able to access an unlimited amount of data about the package.

Such a system would be similar to using an debit card to buy groceries at a supermarket. The debit card id is used a key to verify that there are funds in the account and to withdraw from the account to pay for the transaction.

Given that a short ID is sufficient to access the information about the package, I do not see any need to modify part 15 in order to allow for more data to be sent.
